Pro<sup>2</sup>Future

## MOTIVATION & GOALS

- AI for smart manufacturing** – Applying AI-based modeling, simulation, optimization, and testing to enhance flexibility from enterprise to workstation level
- Multi-level demonstration** – Real-world validation with industry partners in metal batch production at enterprise, shopfloor, workunit, and workstation scales
- Holistic impact** – Assessing ecological, economic, and social benefits alongside technical advancements

## Project FactBox

Project Name AI-BAME  
Project ID MFP Syst.1  
Duration 48 Months

Area 4.2 Cognitive Production Systems

Project Lead Dr. Markus Brillinger

## APPROACH

- Flexibility matrices & methods** – Development of product–production flexibility matrices and supporting methodologies
- Organizational design** – Creation of flexibility-oriented organizational structures
- AI support tools** – Design of AI-based assistance tools for all organizational levels
- Demonstration** – Practical implementation through demonstrators

## CONTRIBUTION

### Scientific contribution

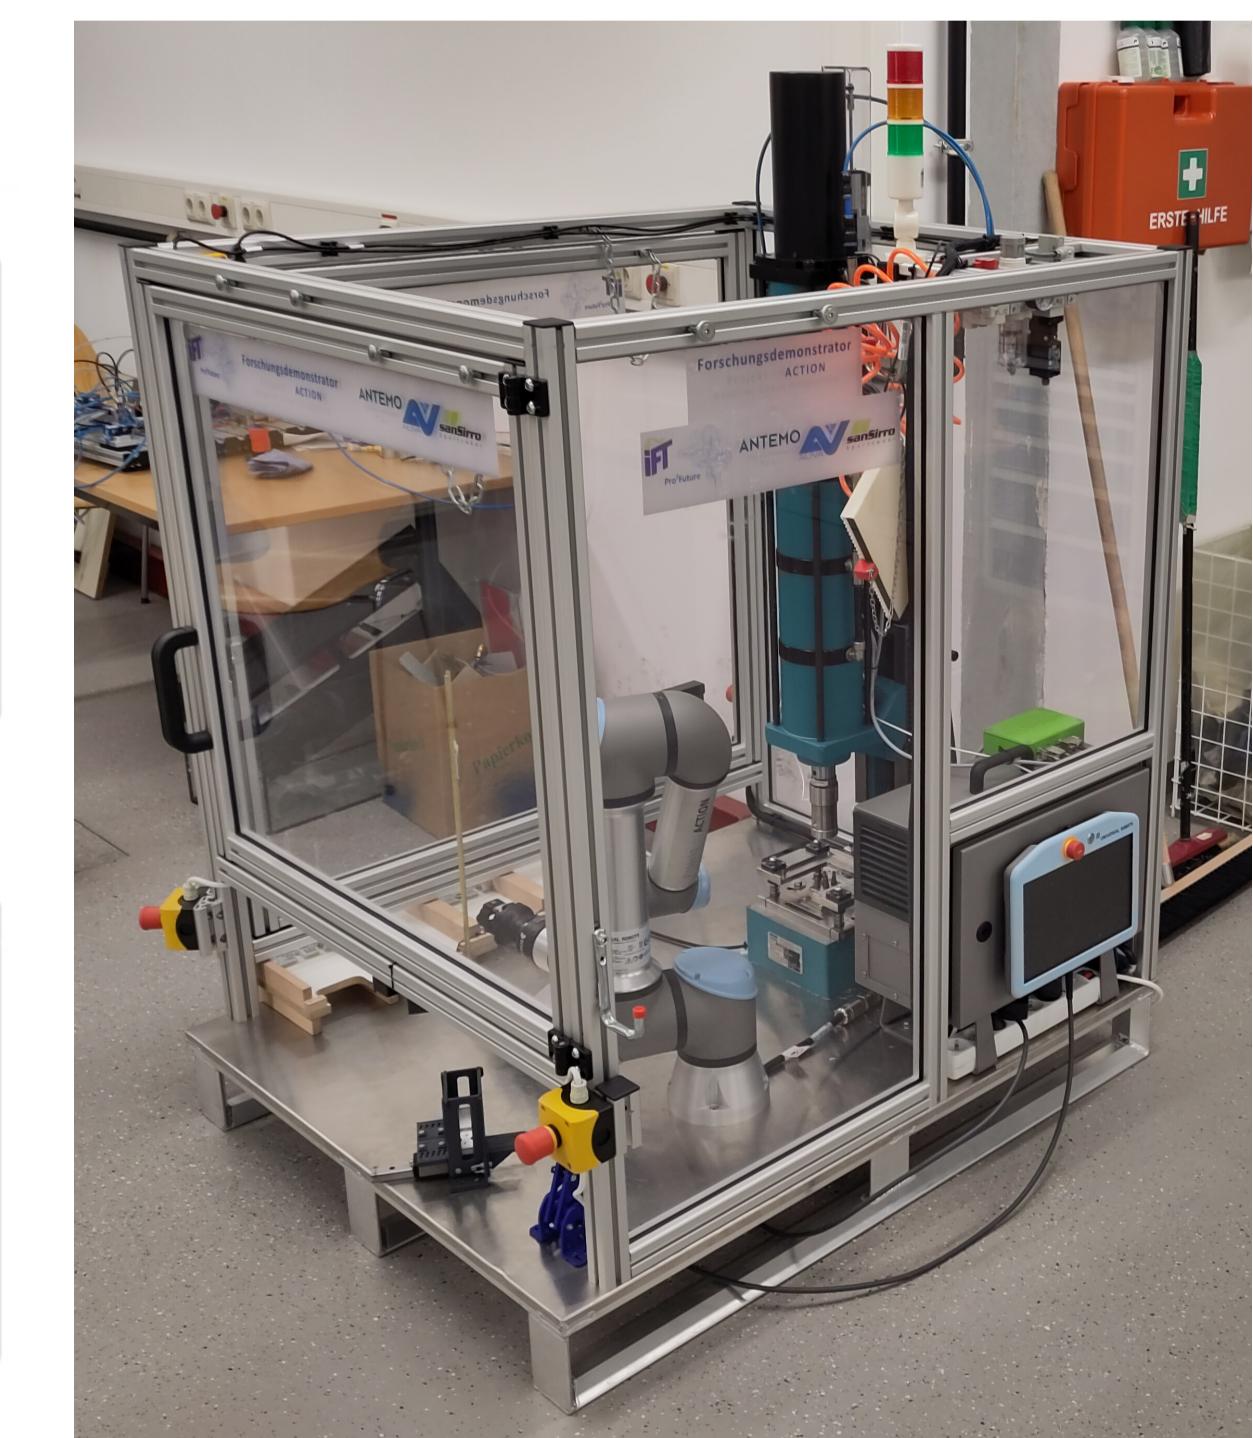

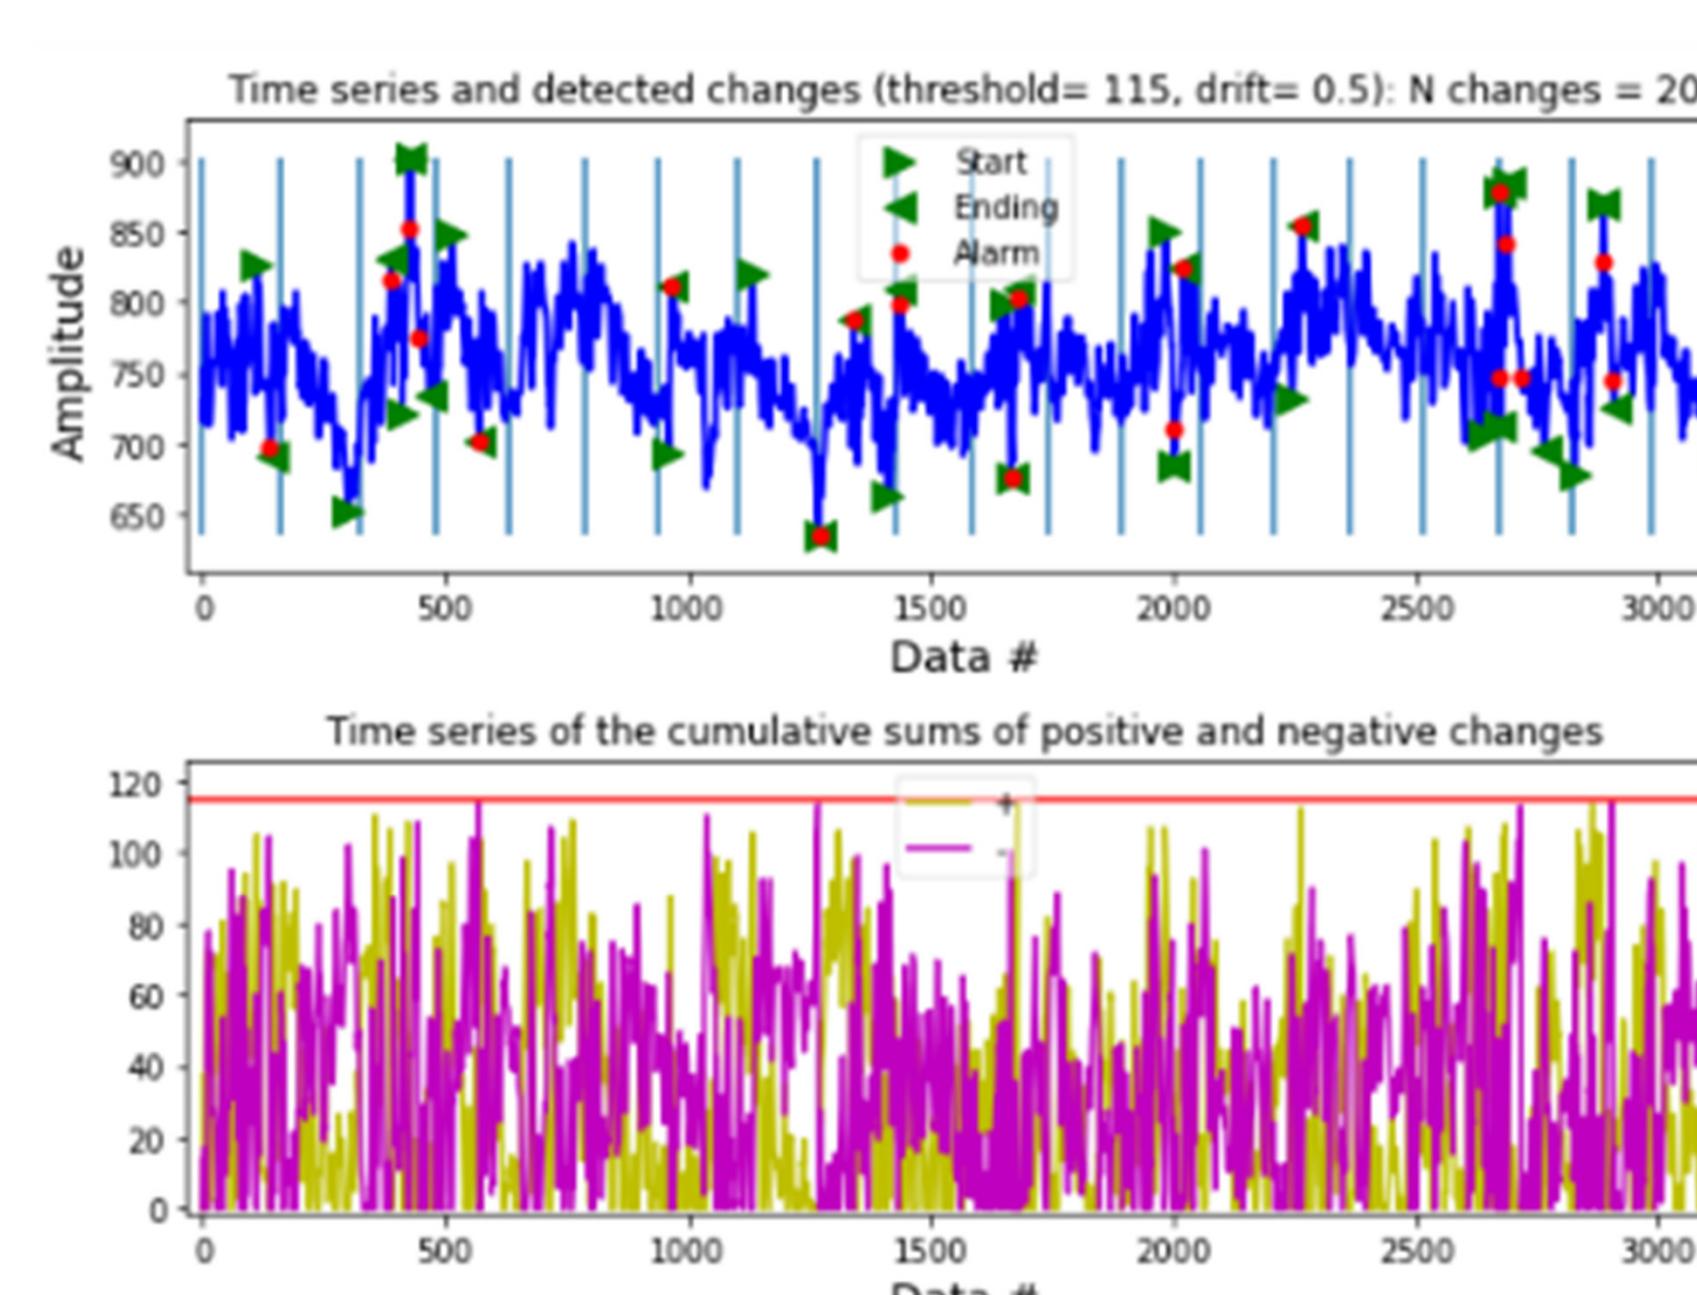

- Development of integrated software and hardware demonstrators enabling real-time data acquisition.

### Economic contribution

- Practical demonstration of AI-supported data collection and analysis enhancing efficiency and flexibility.

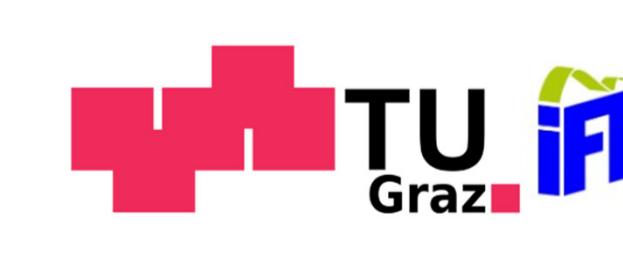

## DEMONSTRATOR

- Software demonstrator** – Inline data acquisition for machines, products, and employee information.
- Hardware demonstrator** – Showcasing use cases from
  - aerospace
  - automotive
  - metal production, and
  - metal processing industries
